

How wireless technology affects product structure and organization.

Evert van de Plassche

Introduction of speaker

TU Delft mechanical engineering (graduated 2001)

Product concepting and development at Vanderlande

- > Item picking robot
- > Case picking system

Machine diagnostics at ASML

Current role is technology architect IoT (internet of things)

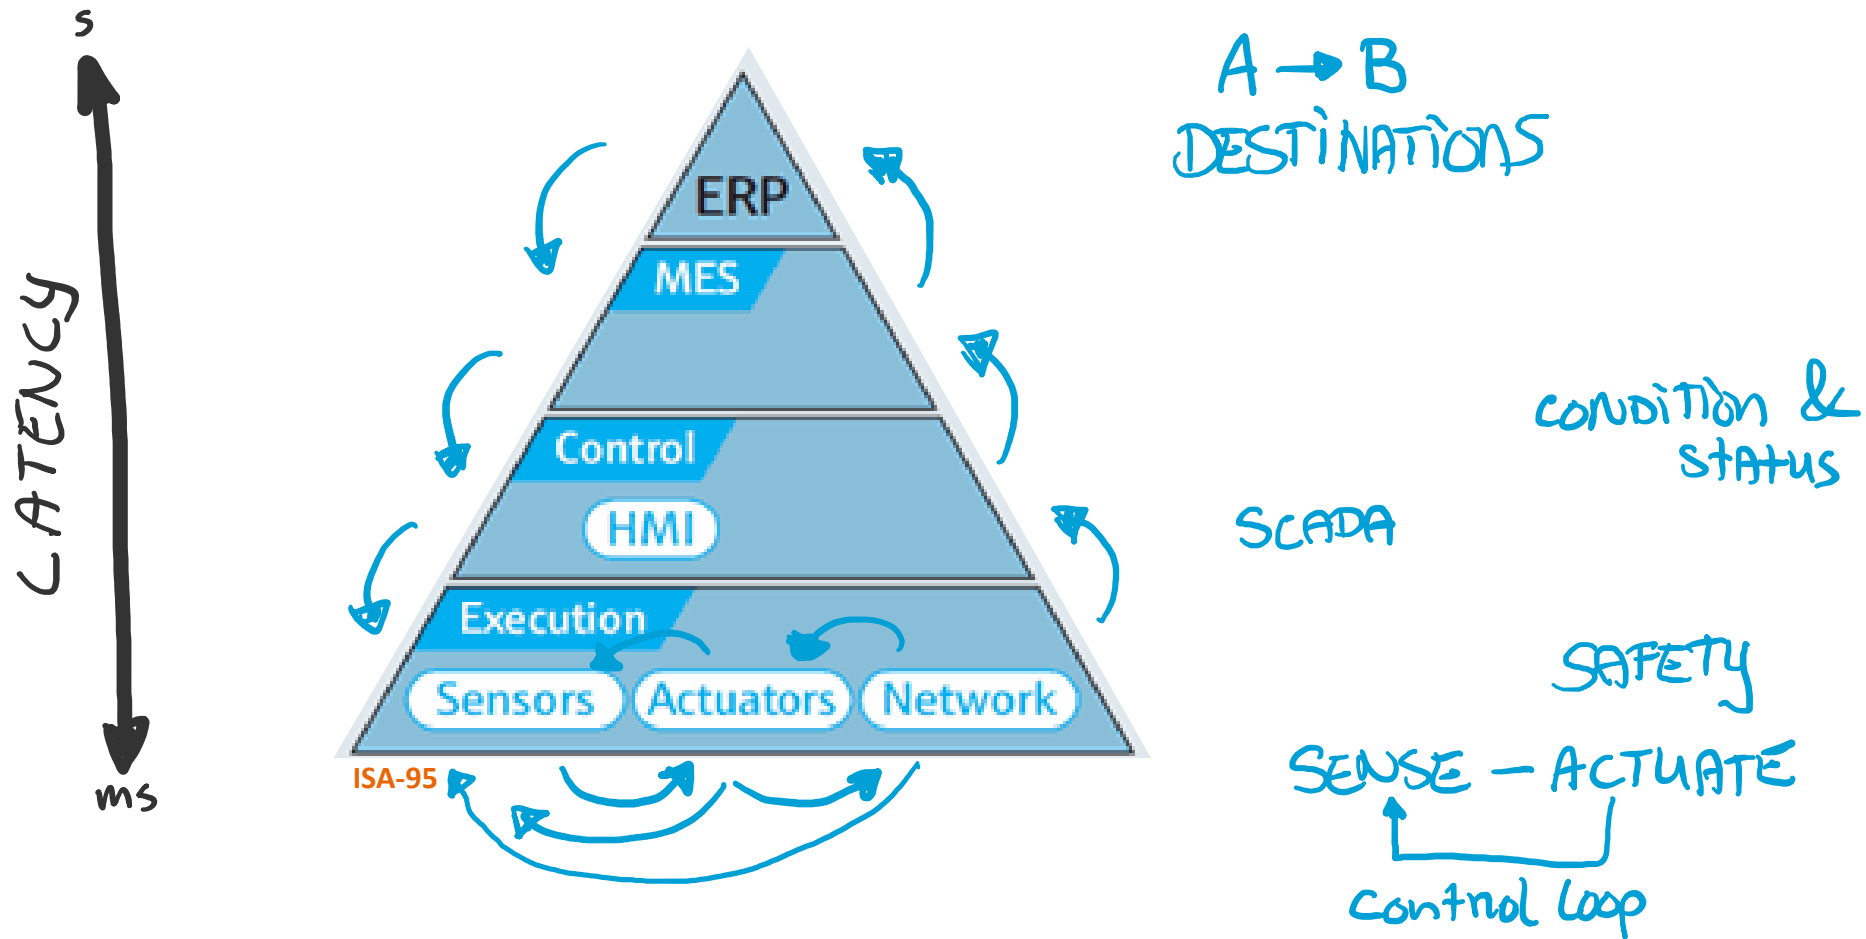

- > AGV for baggage handling
- > Condition monitoring applications

Evert van de Plassche MSc.

Communication

The simple answer

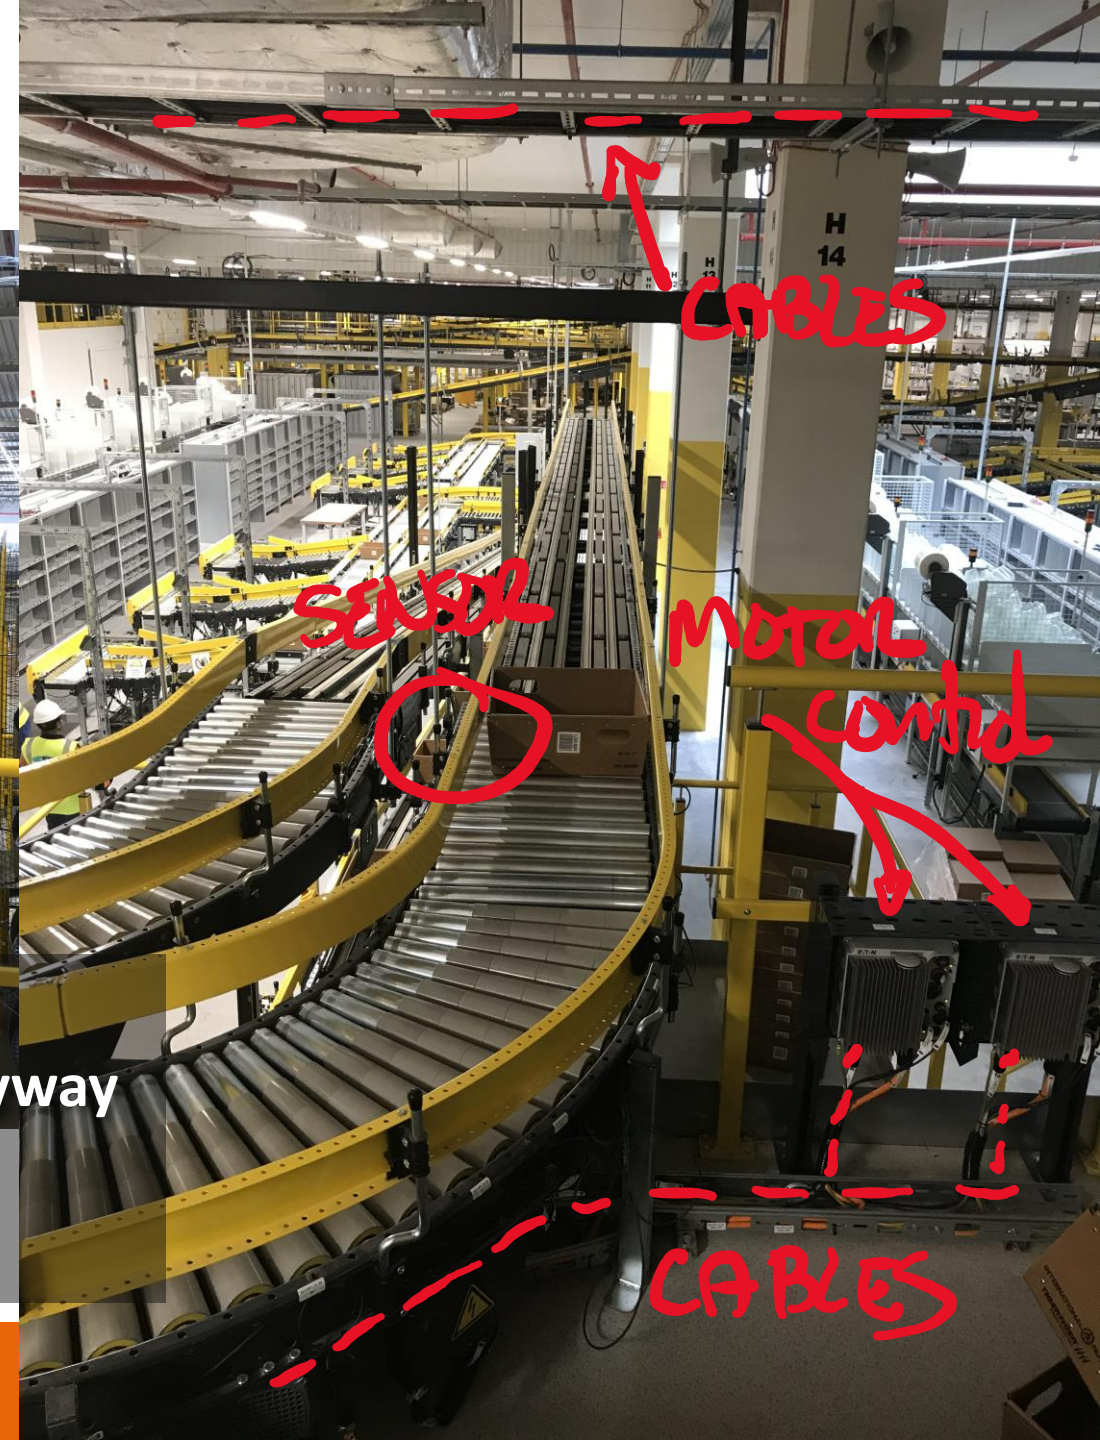

Wired, unless...

Stationary Equipment

Wired

- Powered equipment needs wires anyway
- Large area + "dense"
- High reliability -> redundancy

FLEET – Automated vehicles for baggage handling

Mobile systems

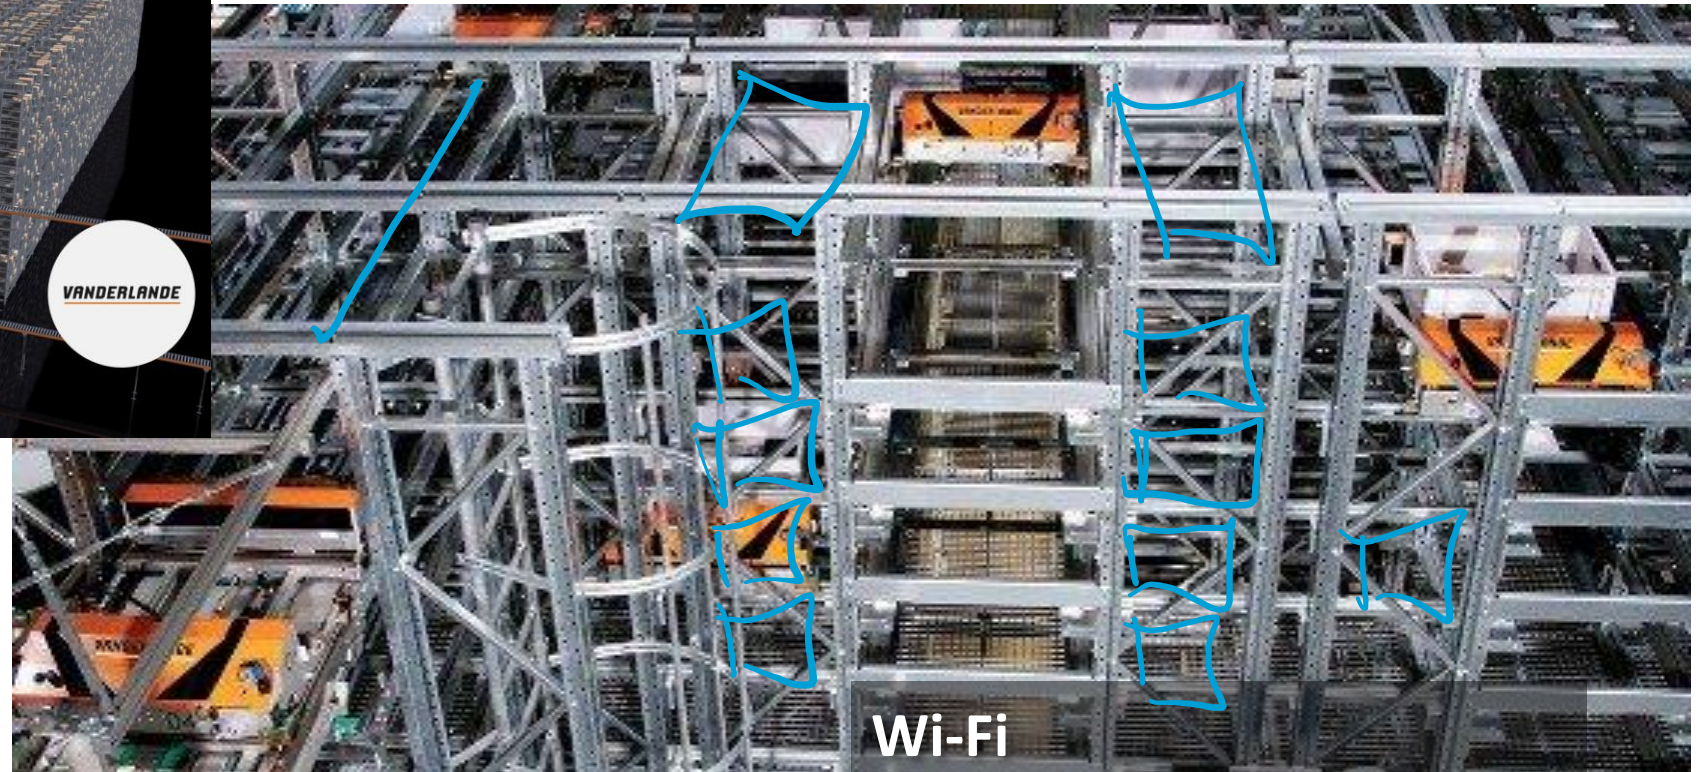

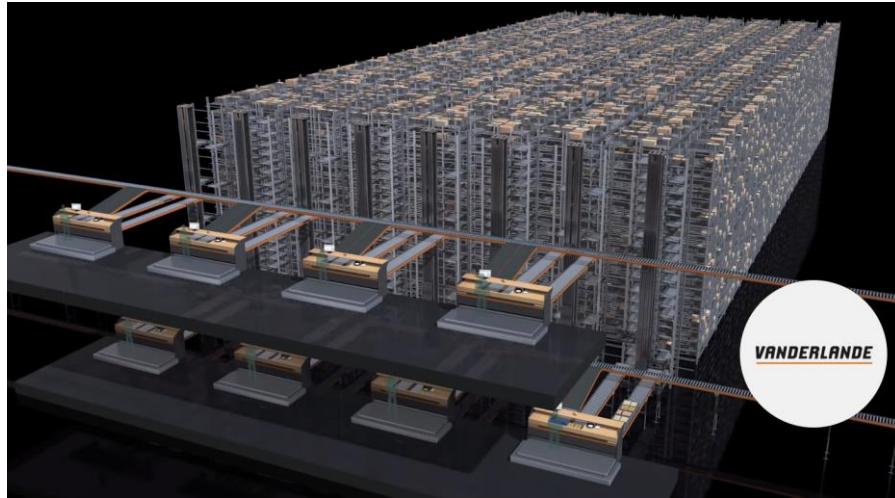

Wi-Fi

- Managed by customer IT
- Passenger terminal → many devices + security
- Fast roaming
- Towards outdoor applications → 4G/5G

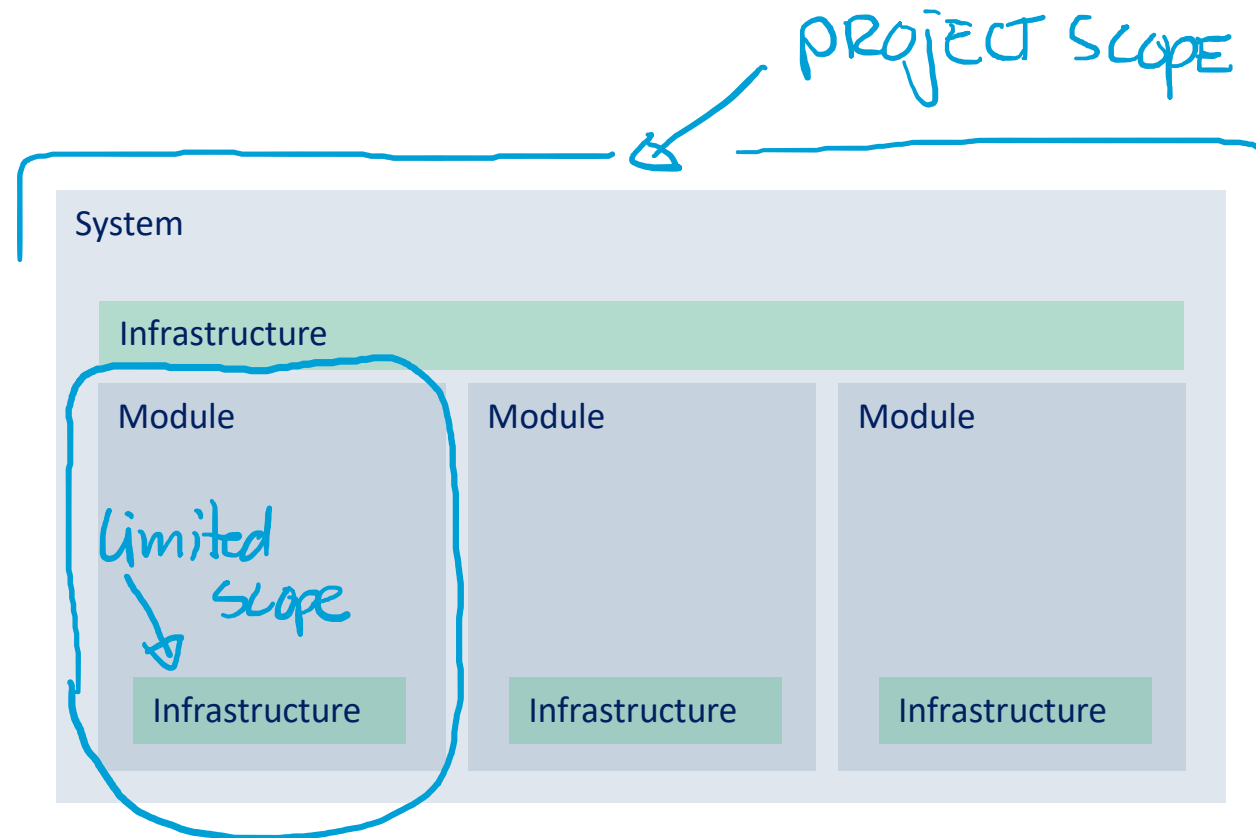

ADAPTO – shuttle-based storage and retrieval system

Wi-Fi

- Varying materials
- Exception handling

Product Structure and Organization

Mainly OT-domain depicted

Challenges when considering wireless

Power supply

- > Batteries, only when acceptable lifetime + remaining life (predictable service) or automatic charging mechanism

Bandwidth

- > Configuration + software OTA upgradeable
- > Reliable, predictable latency

Coverage

- > How to know if the connection is good?
- > Interferences

Safety

- > Continuous connection required

Security

- > Authorization / authentication and encryption
- > Managing who can connect

Location / Asset management

- > Where is the device?

Network management

- > Who manages the network? Guarantees?

Cost

- > Competitive market → multiple networks = multiple effort
- > Training and skillset to cover product lifecycle

Conclusion - How I see the future

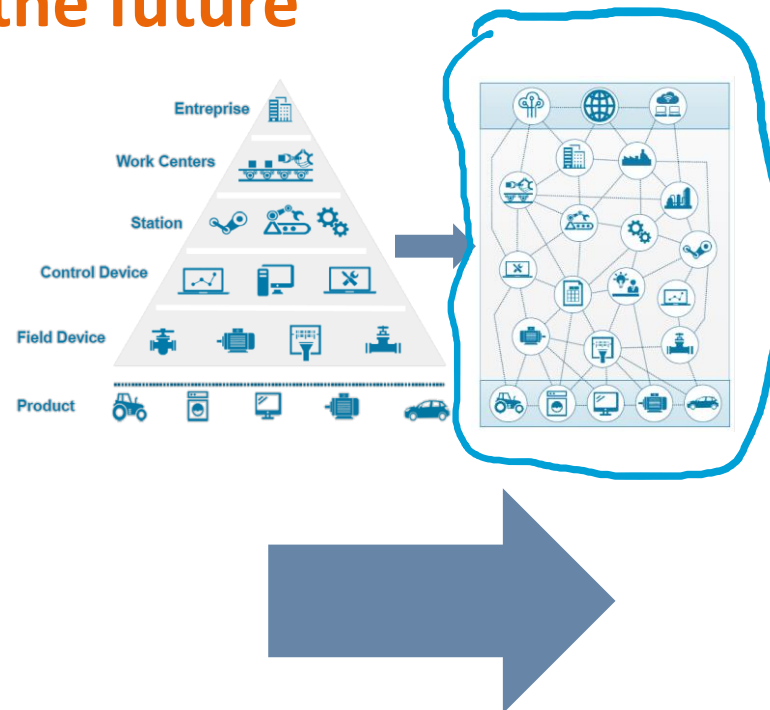

Data driven services

Built-to-evolve systems

(as opposed to built-to-last systems)

Configure-to-order

**Plug-and-play installation and
commissioning**

“Everything Ethernet”

Communication-as-a service

(wired + wireless)

“Ethernet over power”

(industrial setting, as opposed to PoE)

**Power-independent wireless
sensors (device insight)**

(energy harvesting, OTA update,
significant sampling rate)
